Overview

scBOOLSEQ is a Python package for linking scRNA-Seq data and Boolean gene activation states. From a reference dataset, scBOOLSEQ learns a set of statistical criteria which allow the classification of gene expression distributions. Then, scBOOLSEQ offers two complementary features: the binarization of RNA-Seq datasets, and the sampling of RNA counts biased by a given Boolean activity state. This enables the generation of synthetic RNA-Seq datasets from the simulation of Boolean dynamical models, which may then serve as a ground-truth baseline for validating inference methods, including trajectory reconstruction.

Binarization
